

**Date: 2/20/2019**

Additional questions have been received related to wide area network and internet connectivity.

To clarify, the primary internet connection will be located at the Foster City data center. We are requesting 100Mb synchronous internet connectivity at this location.

Secondary SDWAN connections can be asynchronous with minimum 100Mb down and 20Mb up.

We expect a next generation managed services firewall to be implemented in conjunction with the 100Mb synchronous internet connected to the Foster City data center, the site of the internet connection in the RFP diagram. All secondary internet connections require firewall capabilities, but those capabilities maybe in included in a SDN device or other appliance.

The table in the RFP shows synchronous network connectivity requirements between sites.
